Invention Embodiments of the present
invention relate generally to the**

analysis and management of a remote device. In particular, the embodiments relate to a system and method for monitoring and controlling one or more connected remote devices from a user device via a wireless communication channel, such as a wireless local area network (WLAN). Description of the Related Art Remote devices, such as environmental sensors, connected to a network through a remote monitoring

and control (RMC) module use such access to provide data and instructions to one or more connected user devices, such as a computing device. The RMC module allows, for example, remote monitoring and control of home appliances, home automation, video surveillance, remote monitoring and control of a facility, or other aspects of the user device. The RMC module is also capable of providing an interface

for one or more users to access and control the remote device. Thus, a first user can monitor data, check status, change settings, or execute a command, via the user device, from anywhere within range of the user device. Because a remote device typically has a limited amount of battery power, remote devices typically operate on a single battery or a set of batteries, and periodic replacement of

the batteries is required. Remote devices typically operate using wireless communication. A remote device which operates on batteries may use the batteries as a power source. In this case, monitoring and controlling the remote device via a user device typically consumes the battery power on the remote device. This is often unacceptable. The battery operated remote devices are further limited by

the wireless communication range of the remote devices. To maximize the wireless communication range, users of the remote devices need to place the remote devices near a user device. If the remote device is placed far from the user device, the user must place the user device near the remote device in order to communicate with the remote device. Additionally, depending on the location of the remote device,

frequently replacing the batteries is inconvenient, and may be difficult. For instance, if the remote device is kept in a basement, replacing the batteries may be difficult. Moreover, the remote device may require the replacement of the batteries multiple times in a single day. In addition, it is often inconvenient for a user to monitor and control the remote device, if the remote device is located in a location

which is distant from 3e33713323
